Summary

Symptom

Many customers have questions of how to enable/disable HANA for BPC

Other terms

BPC on HANA

Reason and Prerequisites

Consulting

Solution

Enable/Disable HANA for BPC is controlled by two parameters from HANA SP01:

    o   ENABLE_ACCELERATOR
This global IMG parameter is to control whether HANA can be enabled or not
in BPC system level. Y or X is to enable, empty value is to disable.

    o   ACCELERATOR_ON
This environment IMG parameter is to control whether HANA can be enabled or
not in environment level. Y or X is to enable, empty value is to disable.
An environment becomes HANA enable only if both ENABLE_ACCELERATOR and
ACCELERATOR_ON are set to Y or X.

Run program BPC_HANA_MIGRATE_FROM_10 for the environments that are created
before enabling HANA.
